

A dark gray background with a stylized, light gray map pattern. The map features a grid of streets and several irregularly shaped blocks. A prominent circular feature, possibly representing a roundabout or a park, is located in the upper left quadrant.

# Minimaps

Marc Pagès Francesch

# What's a minimap?

- Miniature representation
- Guide the player through the world
- Show the position of important elements

# The use of the minimap

## Inmersion

*The Legend of Zelda: Breath of the Wild*

## Position

# Characteristics of a minimap

*The Witcher 3: Wild Hunt*

*Starcraft 2*

# The future of minimaps

*Monster Hunter World*

*Assassin's Creed Origins*

**Implementation in code**

# TODO 1: Calculate the dimensions of the minimap

You should determine the scale calculating the map size and relating it to the target map width given in config.

## TODO 2: Create a texture for the minimap

- Create a texture not only a pointer to it.
- Check [SDL\\_CreateTexture](#) for further details

## TODO 3: Set this texture as a rendering target and create the minimap

- Check [SDL\\_SetRenderTarget](#) for further information on how to save the information from the render into a texture.
- Don't forget to untarget the texture when you have finished drawing the map!

**TODO 4.1:** Fill the function `WorldToMinimap` to make the representation of the rect in the minimap be in the position it should

**TODO 4.2:** Using `WorldToMinimap` create a white rect which represents the area that the camera records of the world onto the minimap

## TODO 5: Convert a position from the screen to the Minimap and directly to world

- Fill the function which can convert a screen position into world coordinates knowing the minimap position and the scale.

## TODO 6: Transform the position of the mouse into Minimap coordinates and then to the world

- You should use the function made in the last TODO

## TODO 7: Move the camera when the player clicks on the minimap or scrolls the mouse on it while holding the left button

- It should only detect the mouse when it is over the minimap.
- Be aware of the final sign of the camera position!

# Homework

- Add more icons onto the minimap.
- Try replacing the squares by textures.
- Using the config file try changing the corner in which the minimap, the margin and the width.
- Try replacing the black background by a colored one.

**Thank you for your attention!**
